

# GOT IBM CASE MANAGER? THEN YOU NEED...

## Pyramid eXpeditor™ for Case

Developed to improve employee productivity, Pyramid eXpeditor for Case (PX for Case) is a collection of pre-defined IBM Case Manager extension components that helps employees effortlessly manage documents, tasks and cases. PX for Case works seamlessly with any IBM Case Manager solution, making it easy to integrate with any application.

**Bookmarking Viewer:** Efficiency and speed are the names of the game for the Bookmarking Viewer. This high-performance document viewer loads small and extremely large documents and images at blazing fast speeds.

**Bookmarks:** Add document bookmarks that describe key information so underwriters, auditors or managers can click on the bookmark, read associated comments, and jump directly to the information they seek. Quickly finding key information will decrease your overall processing time and increasing productivity.

**Case Details:** Users can easily see and understand content pertaining to each case with the interactive tabular case details and tasks displays. Users can group and sort case details or tasks to highlight ones of interest.

**Case Information Control:** Think of this as your case command center. It's where users access all information related to a case such as actionable tasks, documents, and related cases. Employees can also view work-related attached documents, add comments or dispatch work without even leaving the page.

**Comments Feed:** Ever want to know what people said about a case? The comments feed does just that. Users can add commentary to every task, document or case. Take it a step further and merge all comments together to create a timeline of user correspondence.

**Content Explorer:** Stop wasting time searching. From a single interface, employees can search based on a document's context - its title, folder name, tags, etc. It bridges repositories so you only have to search one time for what you're looking for.

**Hold Operation:** It happens all the time — your employees need additional information from a client, but have no way to put the task or case on hold — until now. PX for Case allows you to put any case on hold while waiting for a document or a task to complete.

**In-Baskets:** Give your teams a quick-access destination to high-priority cases. Our in-baskets are flexible to accommodate changing business needs and workloads. By simplifying how employees find and complete work, you will see an increase in productivity and company morale and a decrease in employee frustration.

**Split/Merge:** Increase employee productivity by providing the ability to split, reassemble and merge documents together. Split/Merge is a way to create or correct documents, fix scanning and classification errors, and assemble document packages. To ensure security, users can set passwords on documents that will carry over from the source document.

**Status Bar:** Enhance productivity by clearly displaying the state of a case with informative icons. Never again will your employees ask, what's the status of this case?

**Visual Tags:** Instantly understand the nature of a document – its status, location and purpose within a process. Each tag has a predefined description and icon created by you!

**Worksheets:** Provide users with a single reference point for all the steps and documentation necessary to complete any task within a process. Worksheets group prescribed checks, tasks, actions and internal comments to ensure no vital steps is overlooked. In addition, users are able to record actions and decisions taken to complete any given item giving managers increased visibility and control.
