

GOT IBM CONTENT NAVIGATOR? THEN YOU NEED...

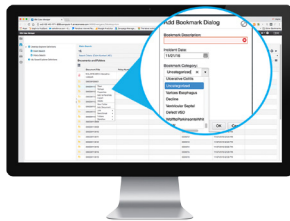

Pyramid eXpeditor™ for Content

Developed to improve employee productivity, Pyramid eXpeditor for Content (PX for Content) is a collection of pre-defined IBM Content Navigator extension components that enhance functionality and efficiency.

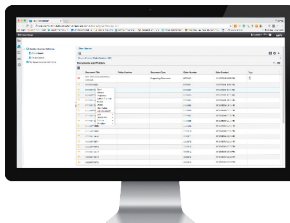

Delivered as plug-and-play components, PX for Content works seamlessly with any IBM Content Navigator solution, making it easy to integrate with any application.

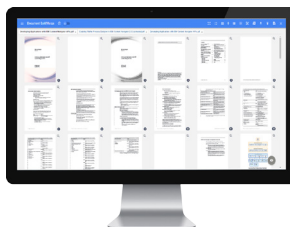

Bookmarking Viewer: Efficiency and speed are the names of the game for the Bookmarking Viewer. This high-performance document viewer loads small and extremely large documents and images at blazing fast speeds.

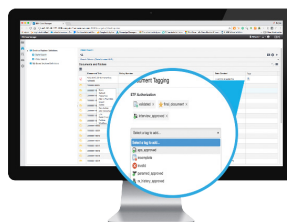

Bookmarks: Add document bookmarks that describe key information so underwriters, auditors or managers can click on the bookmark, read associated comments, and jump directly to the information they seek. Quickly finding key information will decrease your overall processing time and increasing productivity.

Content Explorer: Stop wasting time searching. From a single interface, employees can search based on a document's context - its title, folder name, tags, etc. It bridges repositories so you only have to search one time for what you're looking for.

Split/Merge: Increase employee productivity by providing the ability to split, reassemble and merge documents together. Split/Merge is a way to create or correct documents, fix scanning and classification errors, and assemble document packages. To ensure security, users can set passwords on documents that will carry over from the source document.

Visual Tags: Instantly understand the nature of a document – its status, location and purpose within a process. Each tag has a predefined description and icon created by you!
